Fast and Scalable Eigensolvers for Multicore and Hybrid Architectures

Paolo Bientinesi

AICES, RWTH Aachen
pauldj@aices.rwth-aachen.de

1. The Problem
2. Multicore Processors: MR^3-SMP
3. Distributed Memory Architectures: PMRRR
4. GPUs

Symmetric Dense Eigenproblem

$AX = X\Lambda$	STDEIG
$AX = XB\Lambda$	GENEIG

- Input:

$A \in \mathcal{C}^{n\times n}$,	$A^H = A$
$B \in \mathcal{C}^{n\times n}$,	SPD
$k,\ 1 \le k \le n$	#eigenpairs

- Output:

$X \in \mathcal{C}^{n\times k}$,	eigenvectors
$\Lambda \in \mathcal{R}^{k\times k}$,	eigenvalues

- Accuracy:

$\|AX - X\Lambda\|$,	residual
$\|X^H X - I\|$,	orthogonality

6-stage approach

GENEIG $AX = XB\Lambda$

1	$LL^H = B$	Cholesky factorization	$O(n^3)$
2	$M \leftarrow L^{-1}AL^{-H}$	Reduction to standard form	$O(n^3)$
3	$T = Q^H M Q$	Reduction to tridiagonal form	$O(n^3)$
4	$TZ = Z\Lambda$	Tridiagonal eigenproblem	$O(kn)$–$O(n^3)$
5	$Y = QZ$	Backtransformation #1	$O(kn^2)$
6	$X = L^{-H}Y$	Backtransformation #2	$O(kn^2)$

Nested Eigensolvers

GENEIG → STDEIG → TRDEIG

1	$LL^H = B$	Cholesky factorization	$O(n^3)$
2	$M \leftarrow L^{-1}AL^{-H}$	Reduction to standard form	$O(n^3)$
3	$T = Q^H M Q$	Reduction to tridiagonal form	$O(n^3)$
4	$TZ = Z\Lambda$	Tridiagonal eigenproblem	$O(kn)$–$O(n^3)$
5	$Y = QZ$	Backtransformation #1	$O(kn^2)$
6	$X = L^{-H}Y$	Backtransformation #2	$O(kn^2)$

Algorithms

Stage 4: TRDEIG

1958	Bisection + Inverse Iteration (BI)	subsets	$O(kn^2)$
1961	QR	high-accuracy	$O(n^3)$
1981	Divide & Conquer (DC)	BLAS3, accurate	$O(n^3)$
1997	MRRR	subsets, no re-orth.	$\mathbf{O(kn)}$

Algorithms

Stage 4: TRDEIG

1958	Bisection + Inverse Iteration (BI)	subsets	$O(kn^2)$
1961	QR	high-accuracy	$O(n^3)$
1981	Divide & Conquer (DC)	BLAS3, accurate	$O(n^3)$
1997	MRRR	subsets, no re-orth.	$\mathbf{O(kn)}$

Stage 3: Reduction to TRDEIG

- 1-stage Householder
- Successive Banded Reduction

1 The Problem

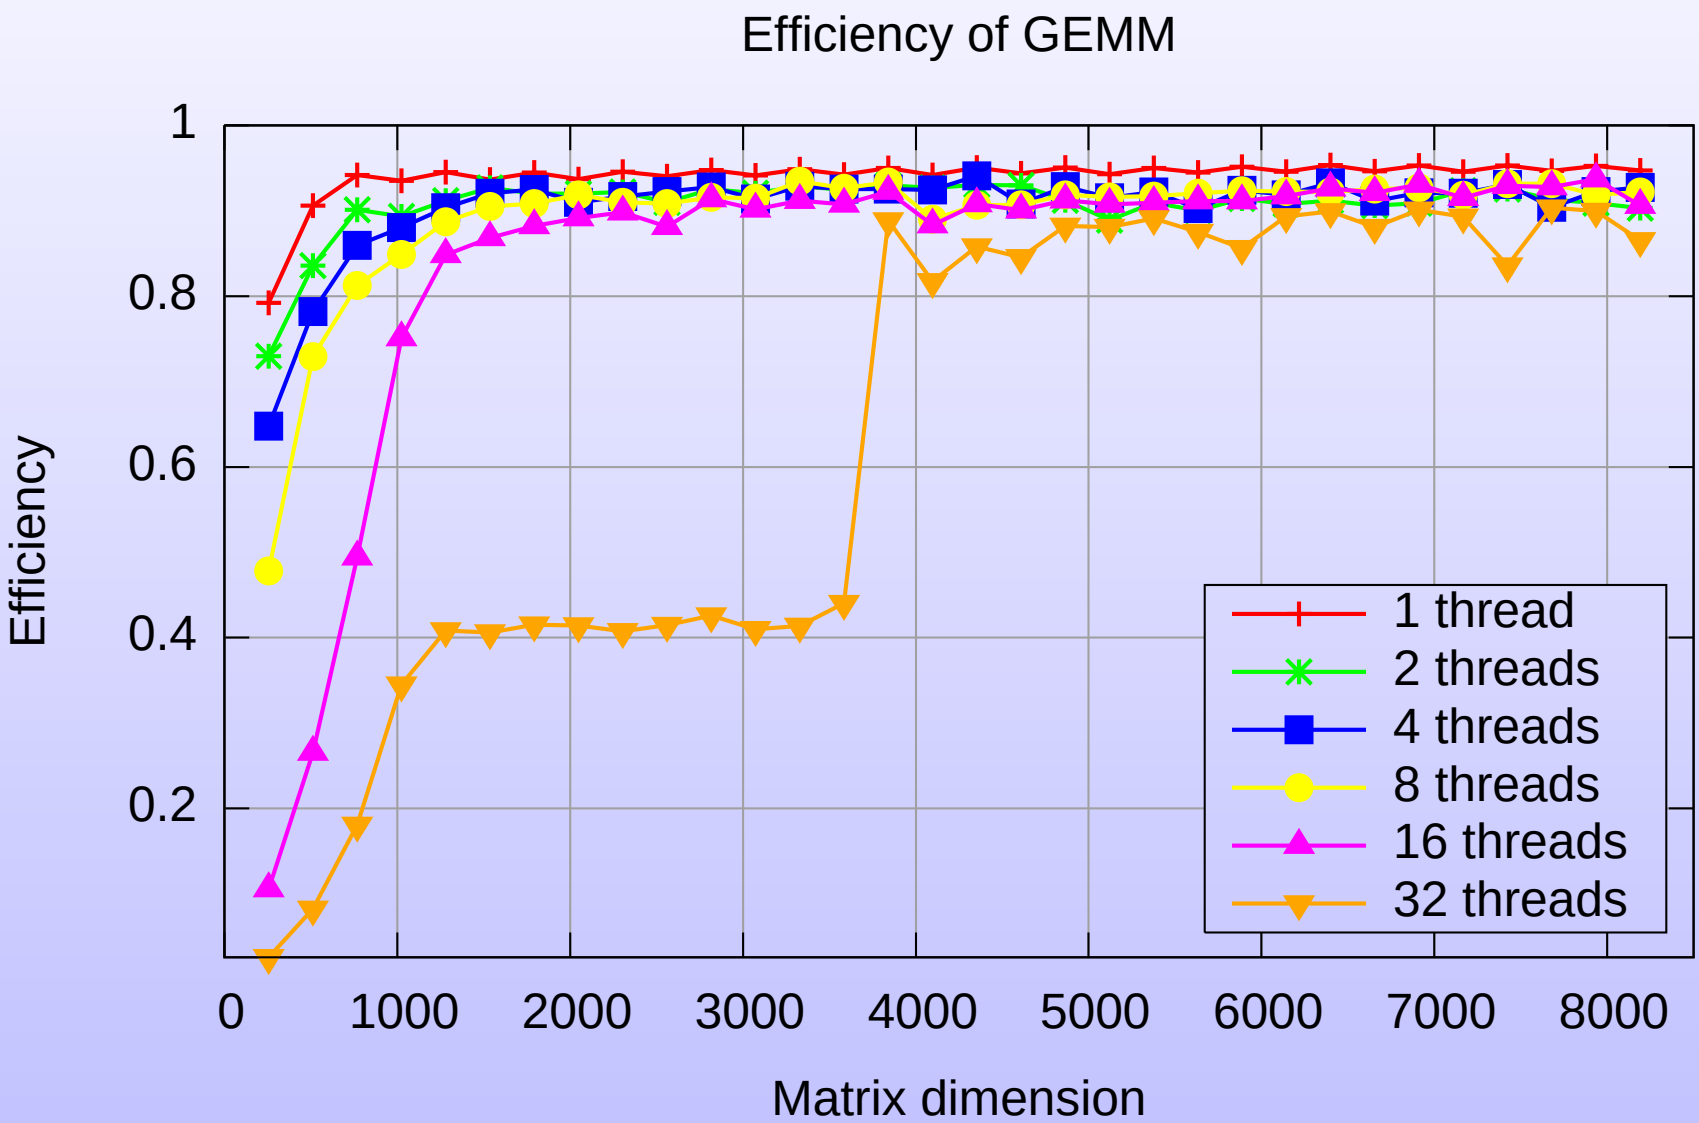
2 Multicore Processors: MR^3-SMP

3 Distributed Memory Architectures: PMRRR

4 GPUs

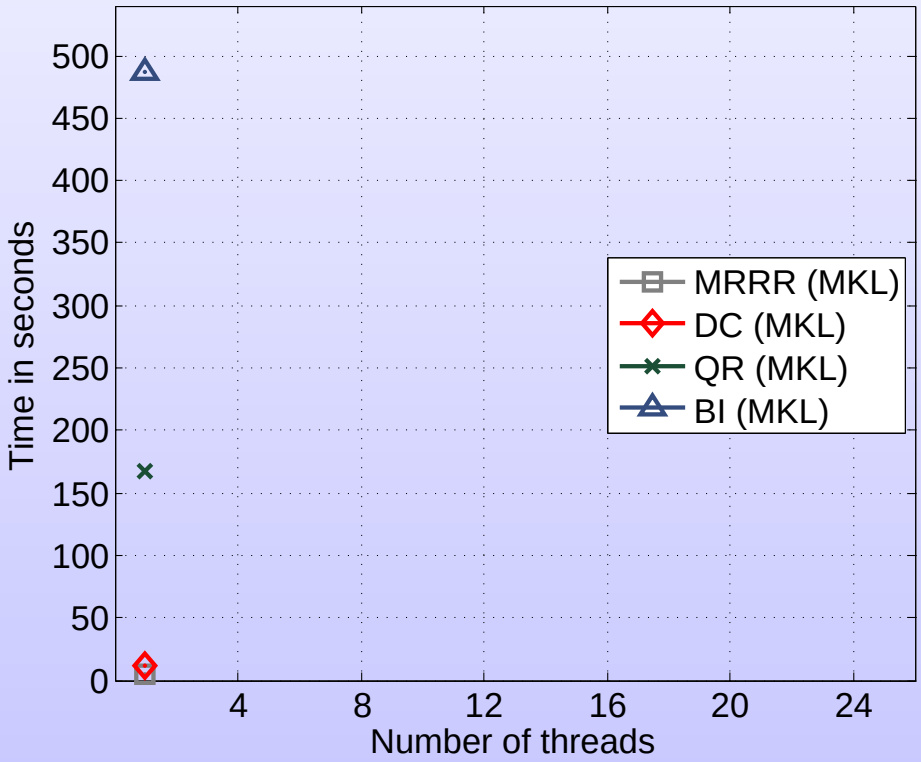
Multi-threaded BLAS

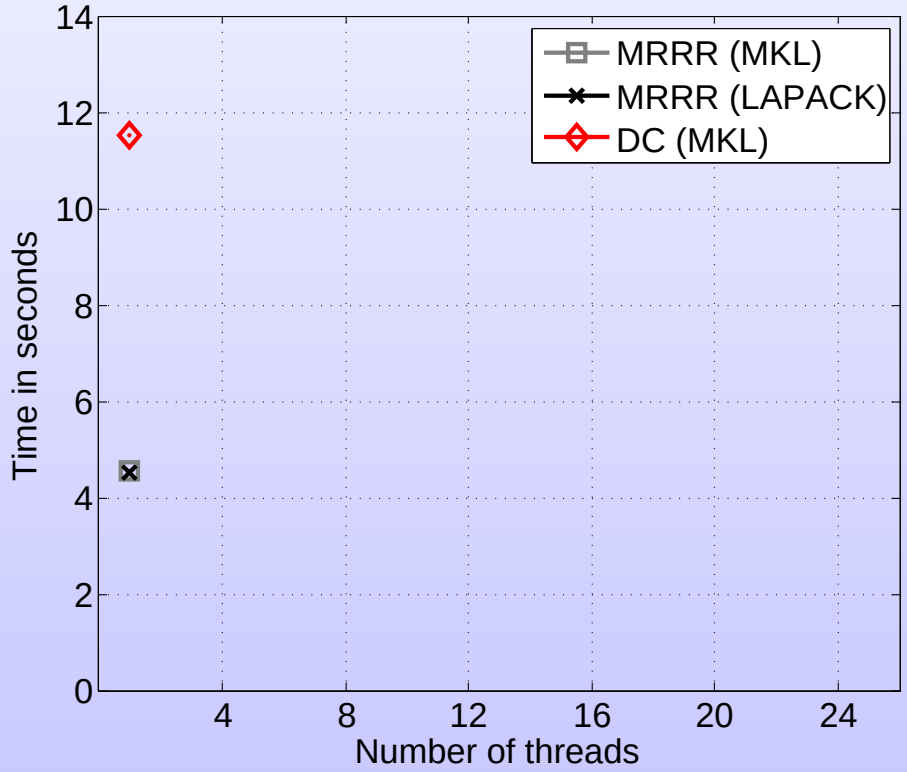
Xeon, 32 physical cores



Multi-threaded BLAS for TRDEIG?

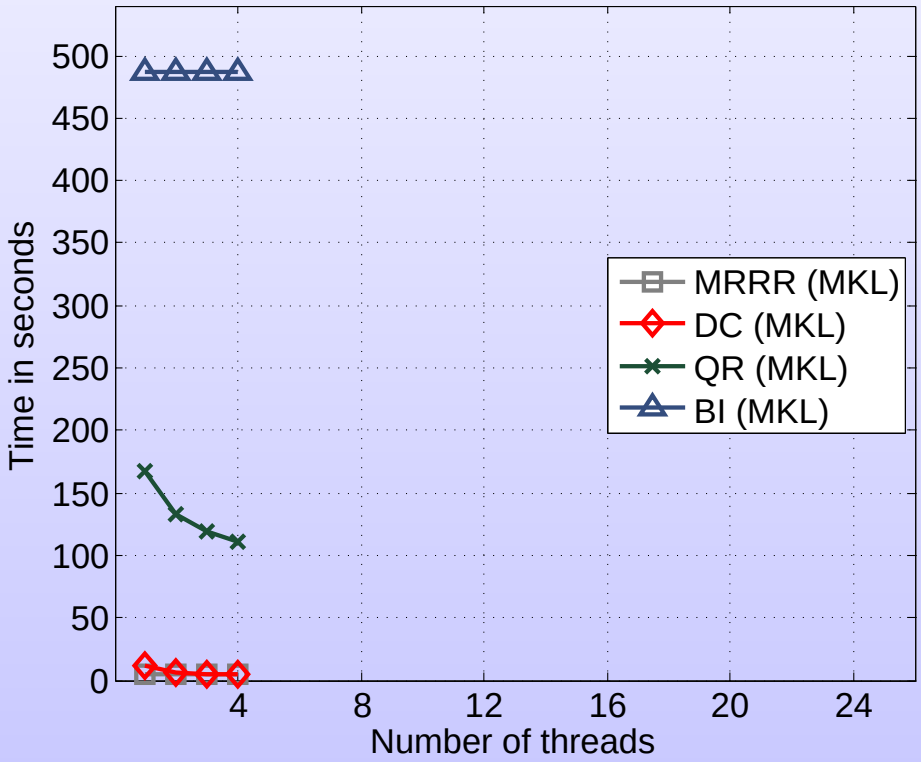
Tridiagonal eigensolvers. Matrix size=4289, from DFT.

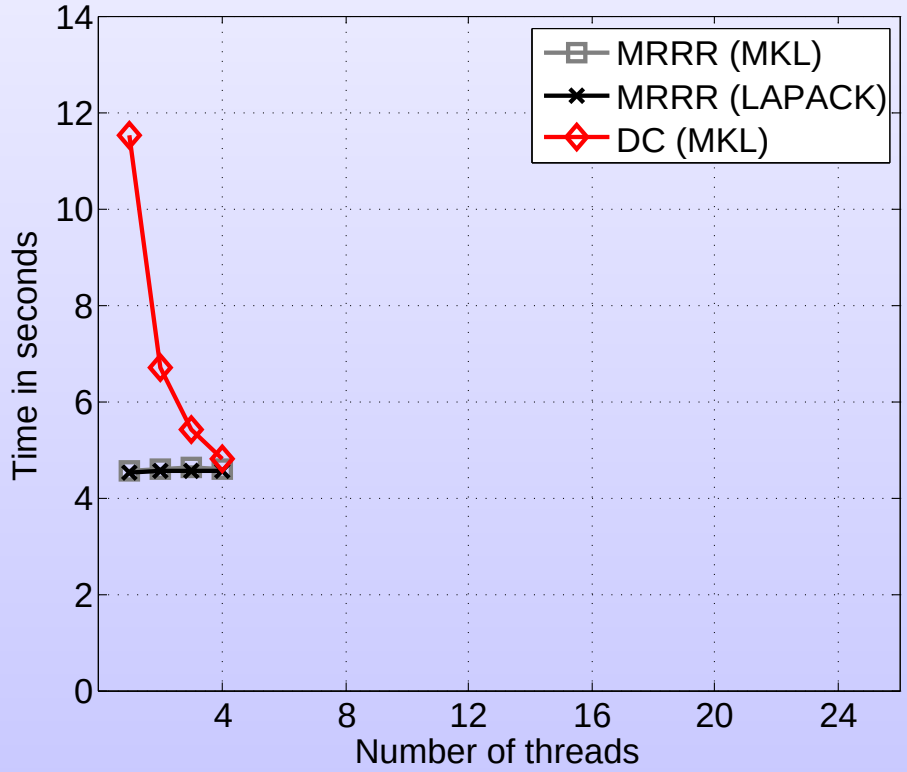




Multi-threaded BLAS for TRDEIG?

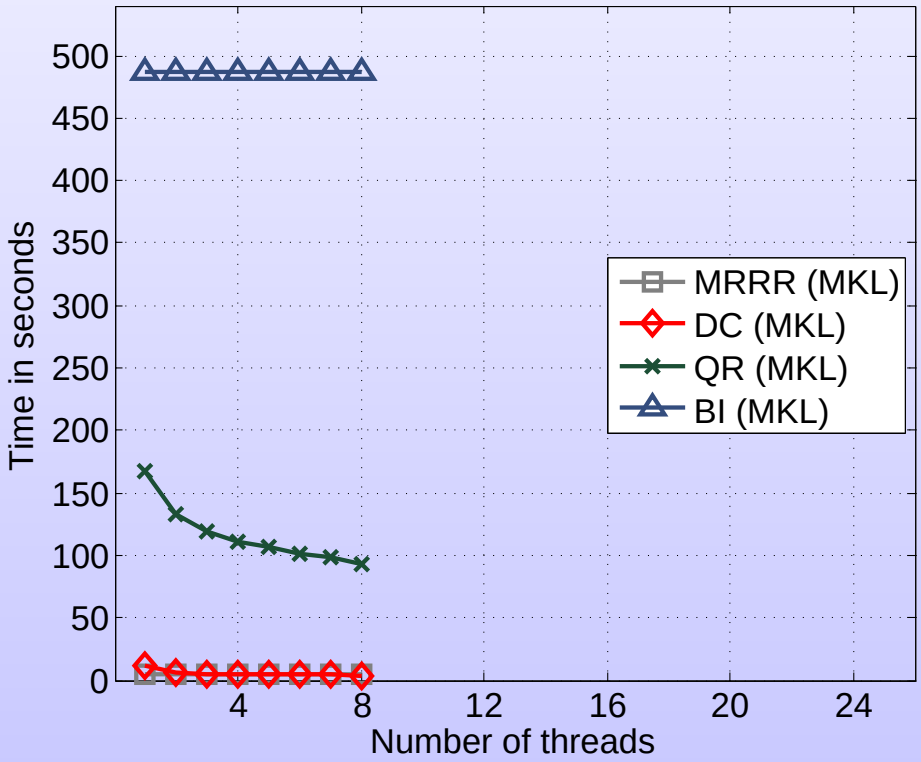
Tridiagonal eigensolvers. Matrix size=4289, from DFT.

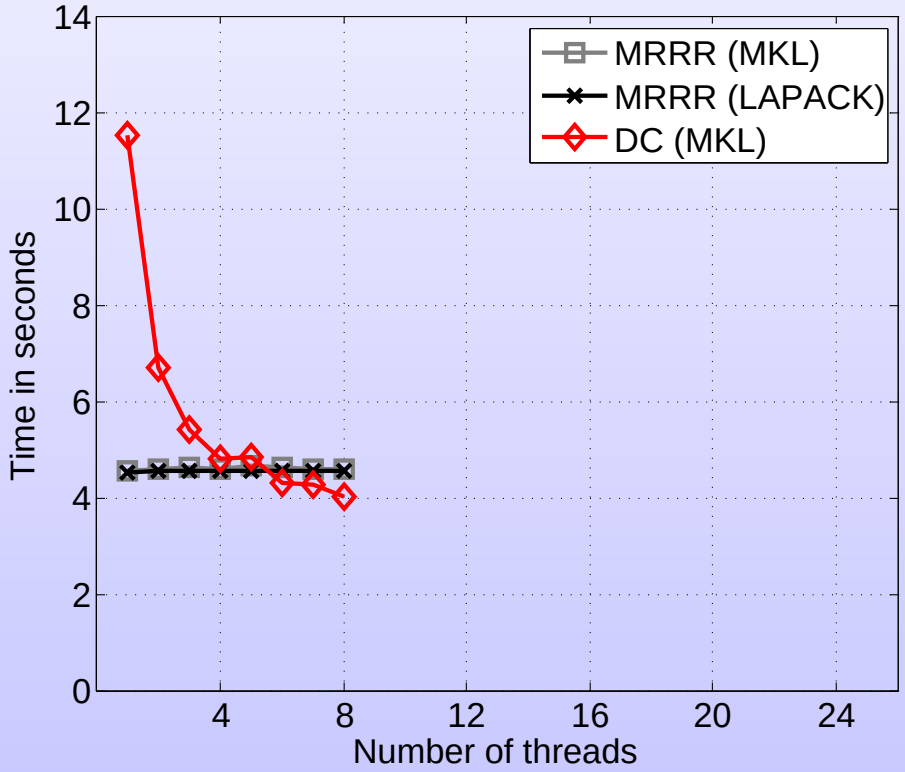




Multi-threaded BLAS for TRDEIG?

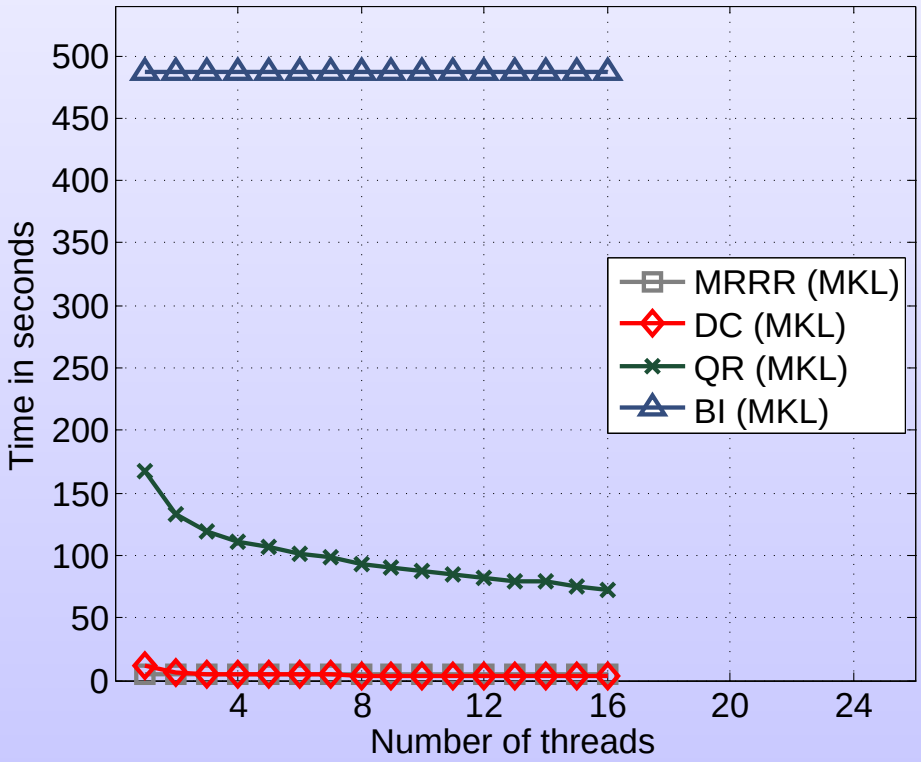
Tridiagonal eigensolvers. Matrix size=4289, from DFT.

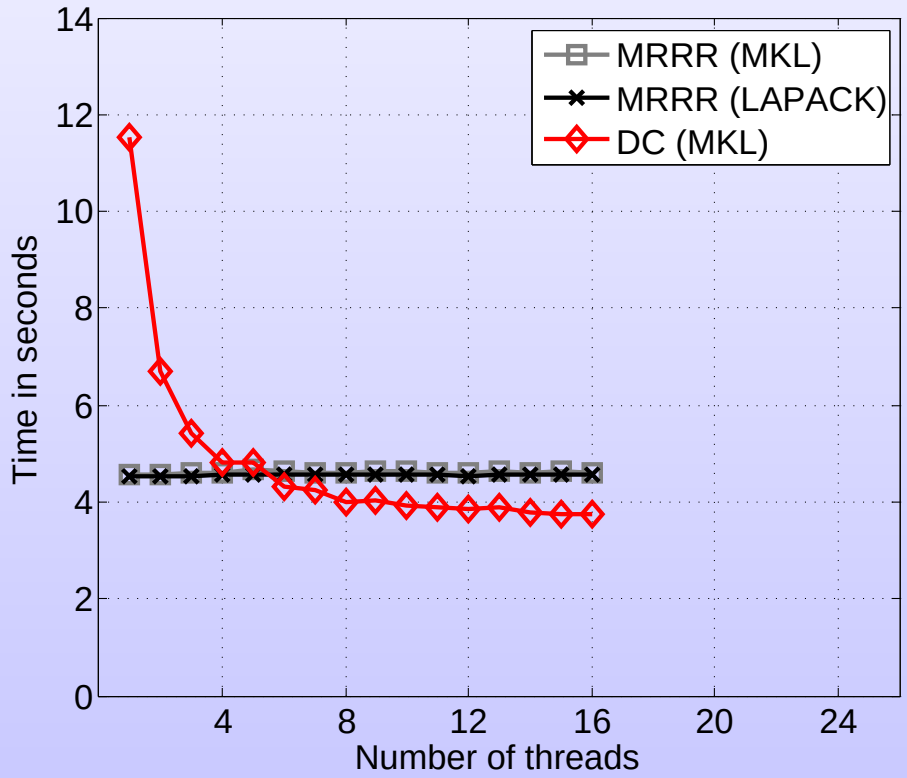




Multi-threaded BLAS for TRDEIG?

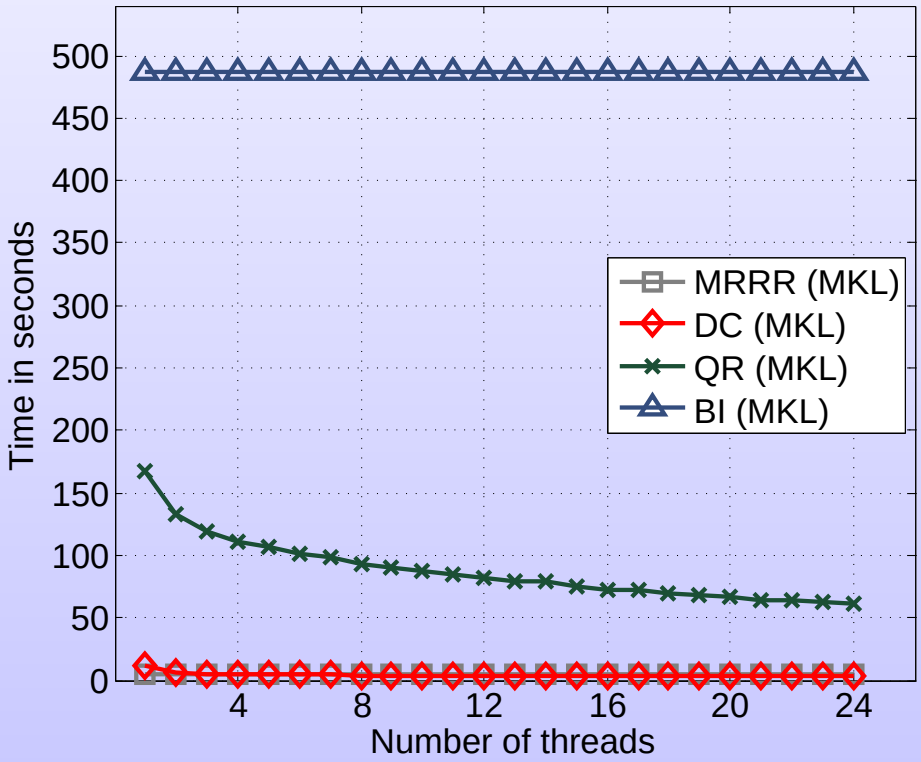
Tridiagonal eigensolvers. Matrix size=4289, from DFT.

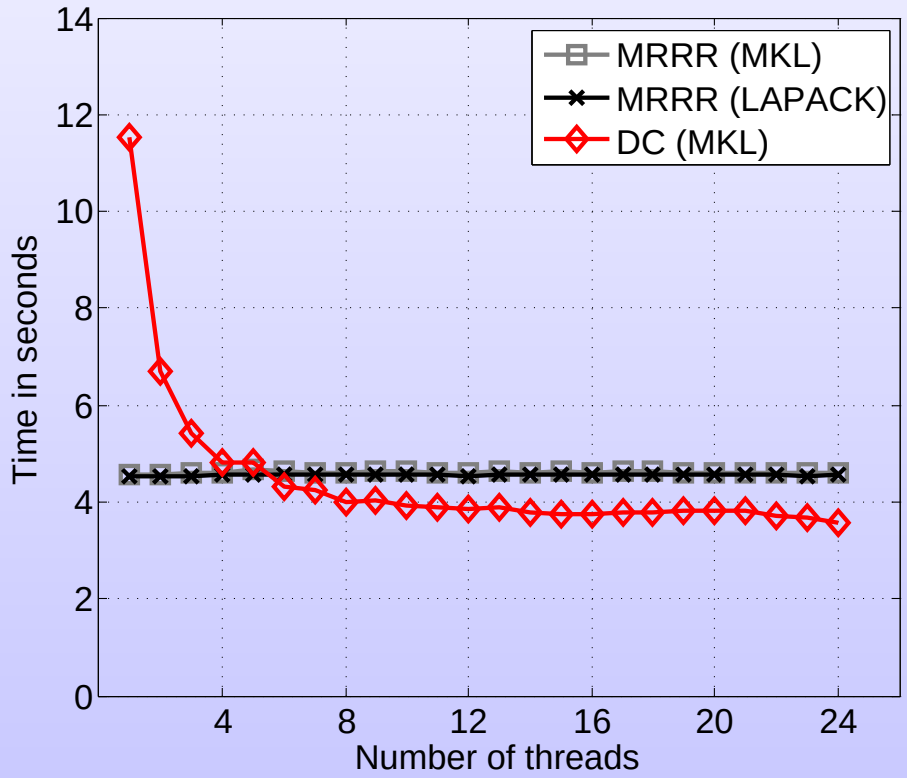




Multi-threaded BLAS for TRDEIG?

Tridiagonal eigensolvers. Matrix size=4289, from DFT.



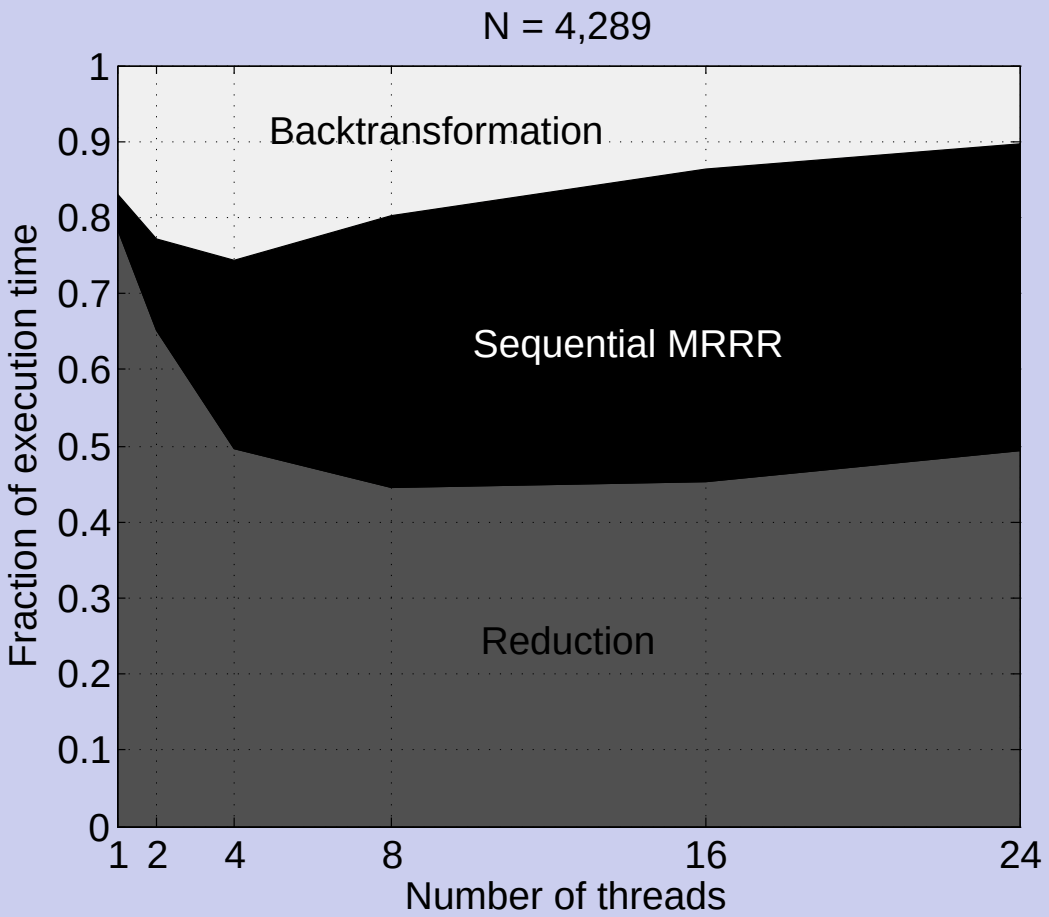


More motivation?

"MR3 is $O(n^2)$ anyway..."

More motivation?

"MR3 is $O(n^2)$ anyway..."



MRRR – Dhillon & Parlett (1998)

Multiple Relatively Robust Representations

- first stable algorithm to compute k eigenpairs in $O(nk)$ ops
- no reorthogonalization

MRRR – Dhillon & Parlett (1998)

Multiple Relatively Robust Representations

- first stable algorithm to compute k eigenpairs in $O(nk)$ ops
- no reorthogonalization
- 1) eigenvalues $\rightarrow$ 2) eigenvectors + eigenvalues
- eigenvalues: *dqds* or *Bisection*
- eigenvectors:

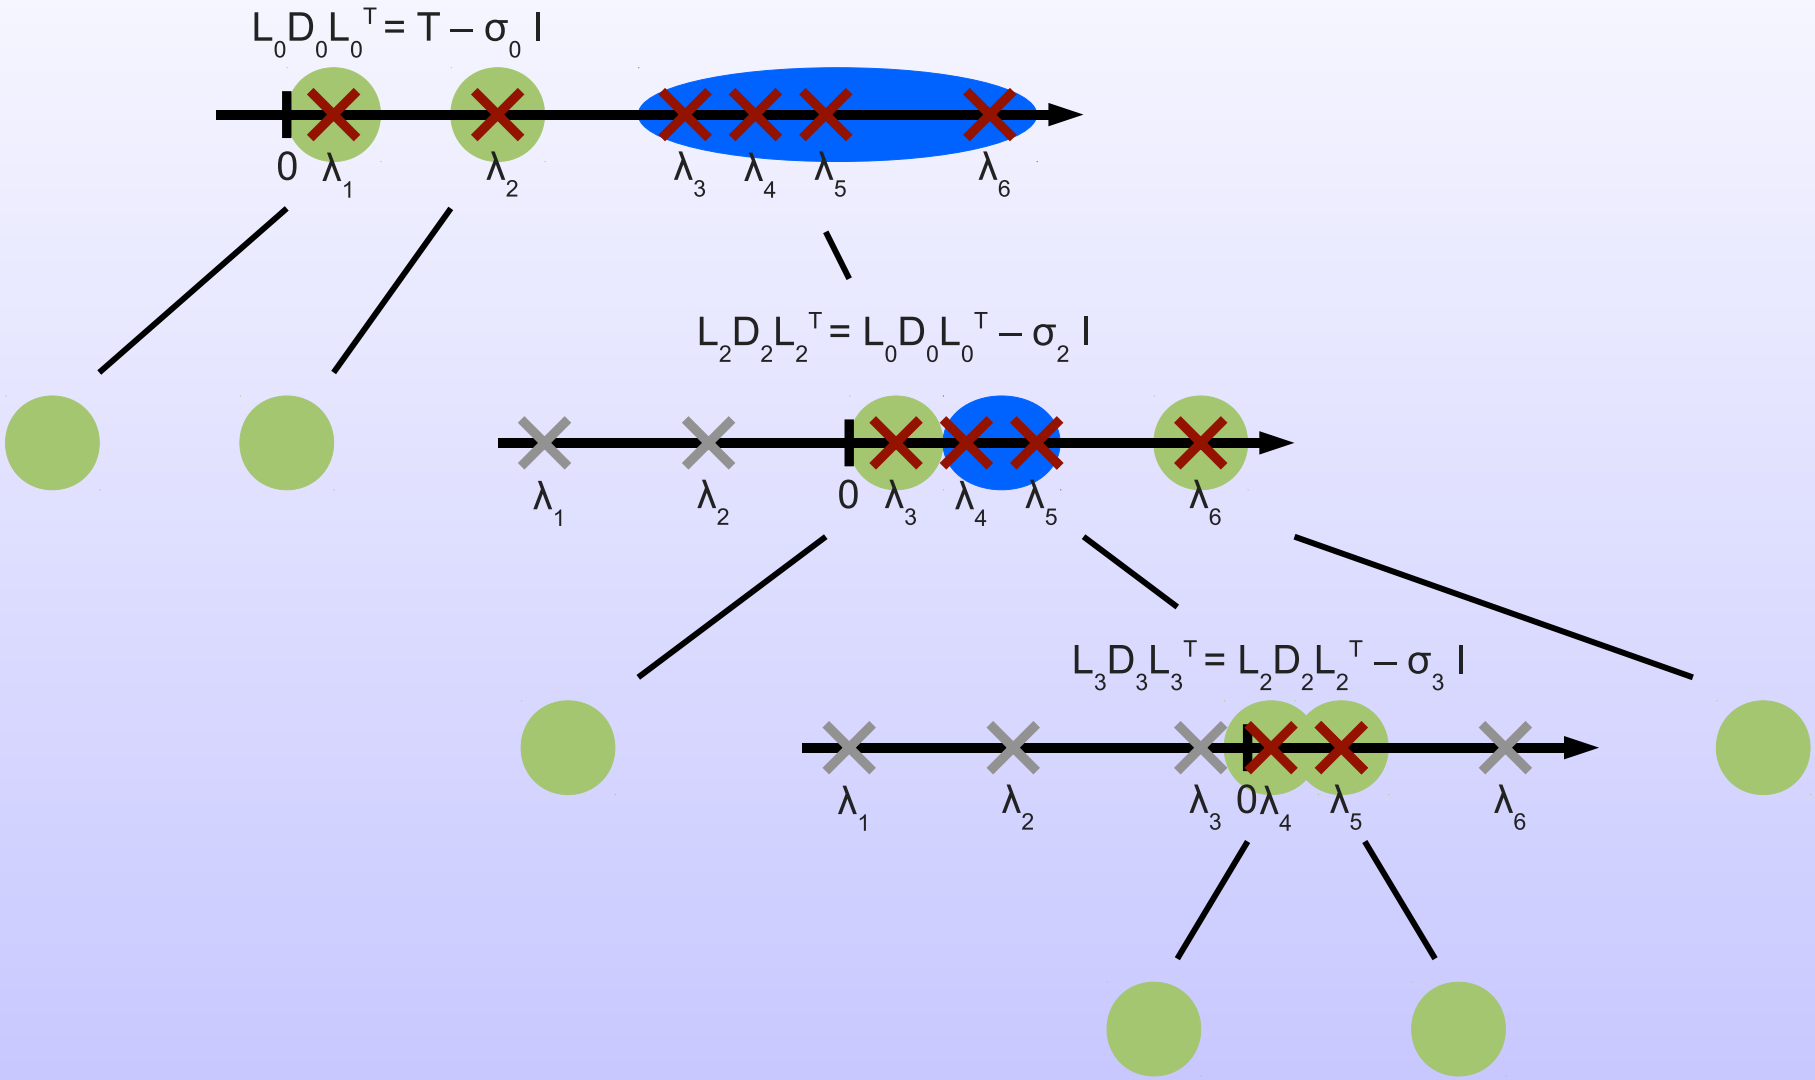
Representation Tree



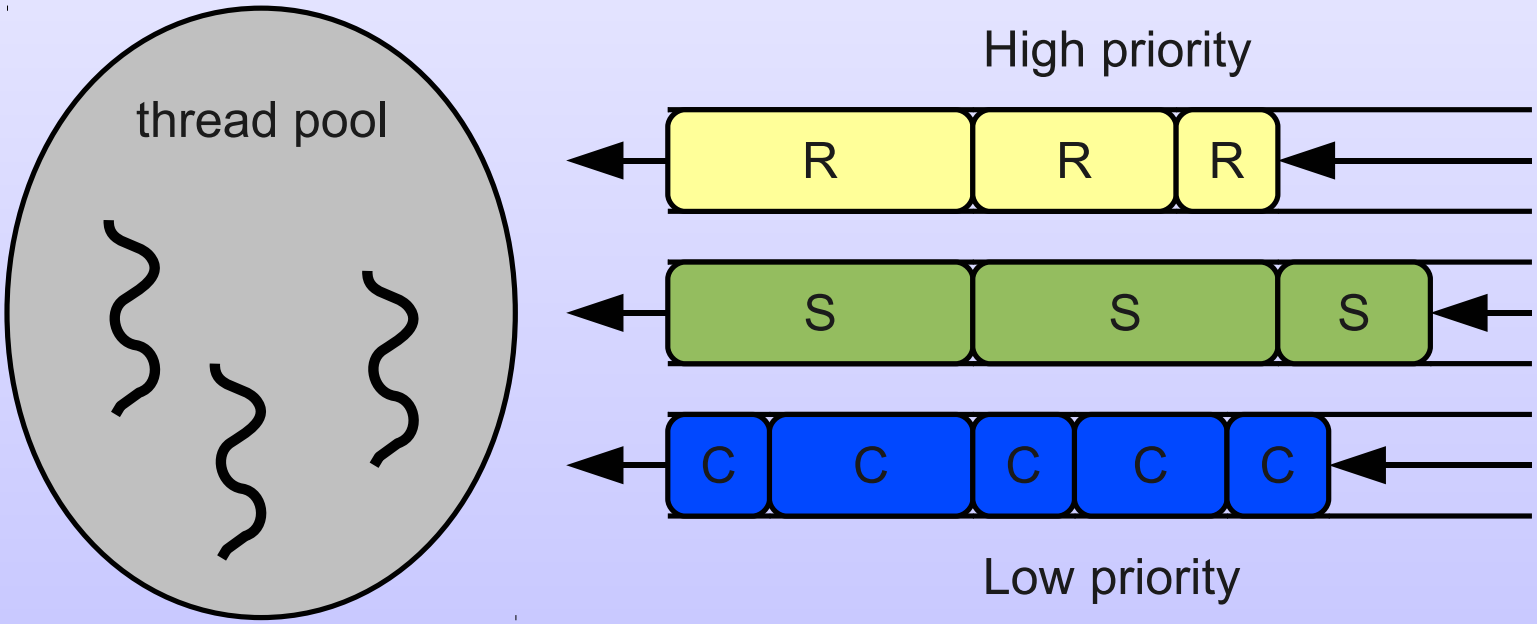
MR^3-SMP: the work queue

Tasks:

a) Singleton $\Rightarrow$ **S**: Eigenvector computation

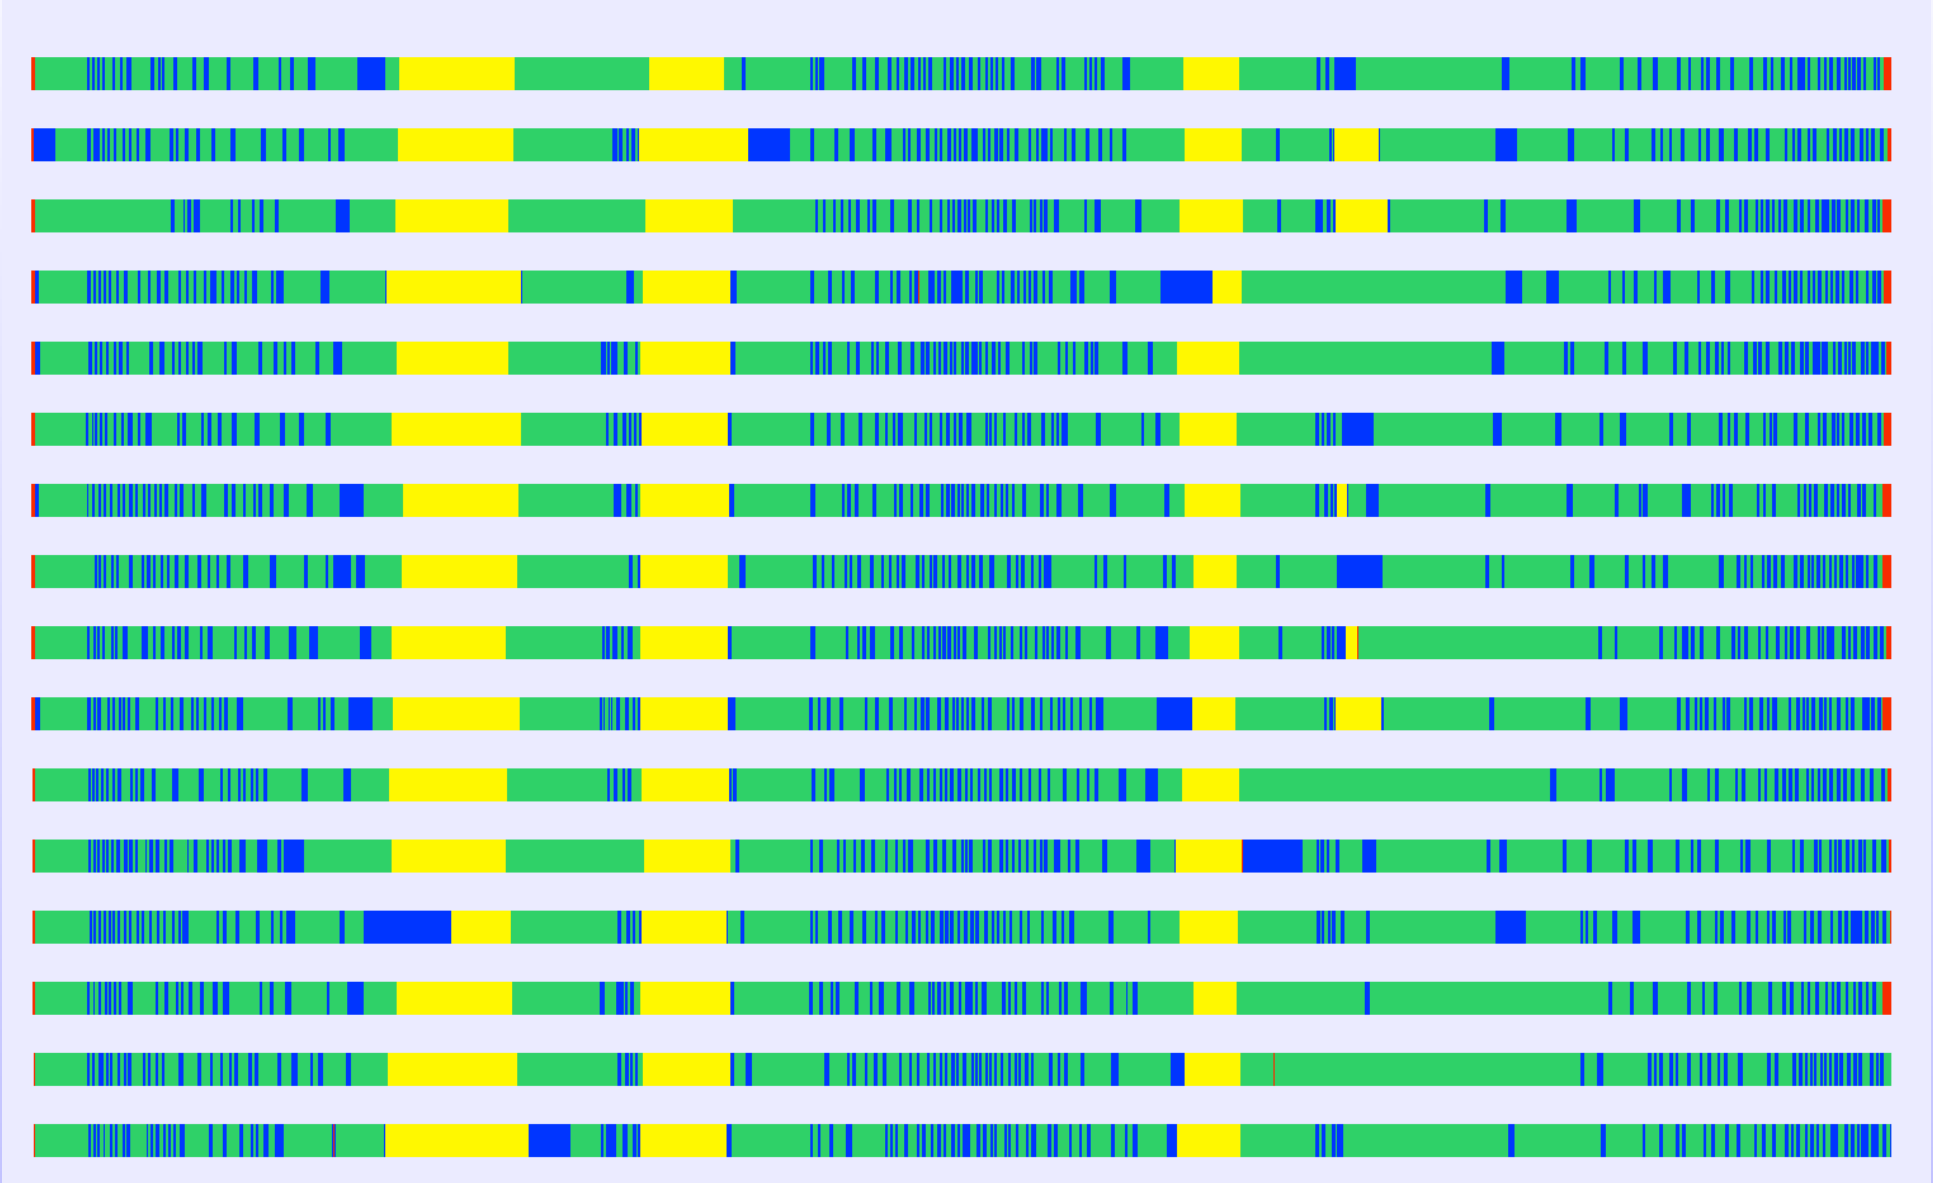
b) Cluster $\Rightarrow$ **C**: Shift + new representation (RRR)

c) New RRR $\Rightarrow$ **R**: Eigenvalues refinement



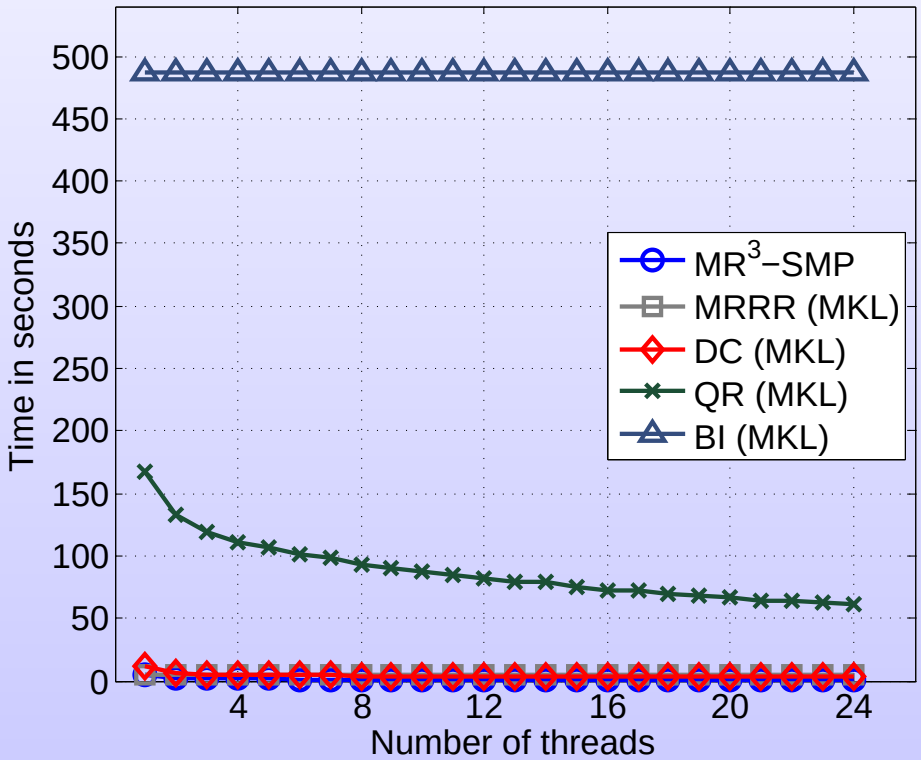
Example trace: 16 cores—eigenvectors

Matrix size: 12387 Execution time: 3.3s Sequential: 49.3s (LAPACK)



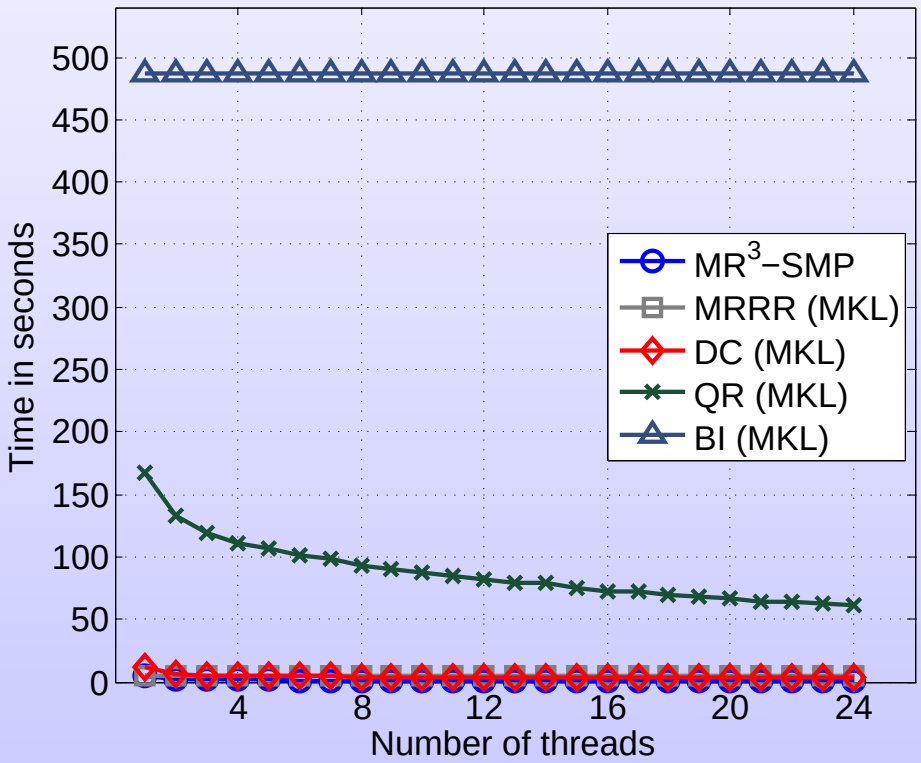
MR^3-SMP: Timings

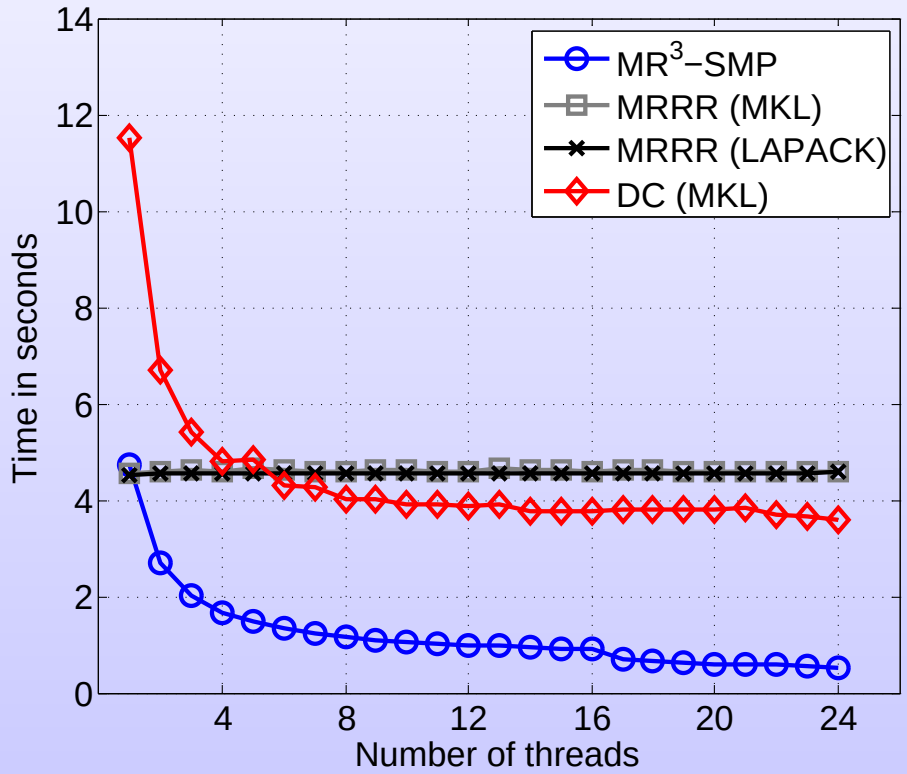
Matrix size=4289, from DFT.



MR^3-SMP: Timings

Matrix size=4289, from DFT.





A larger example

Matrix size=16023; frequency response analysis of automobiles.

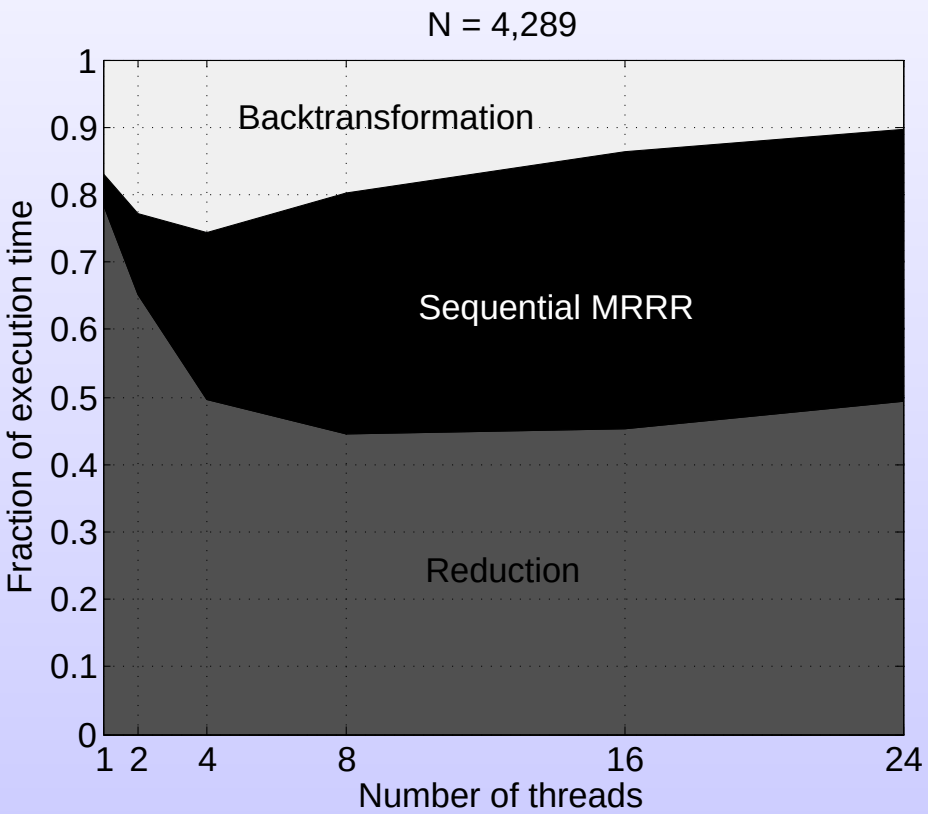
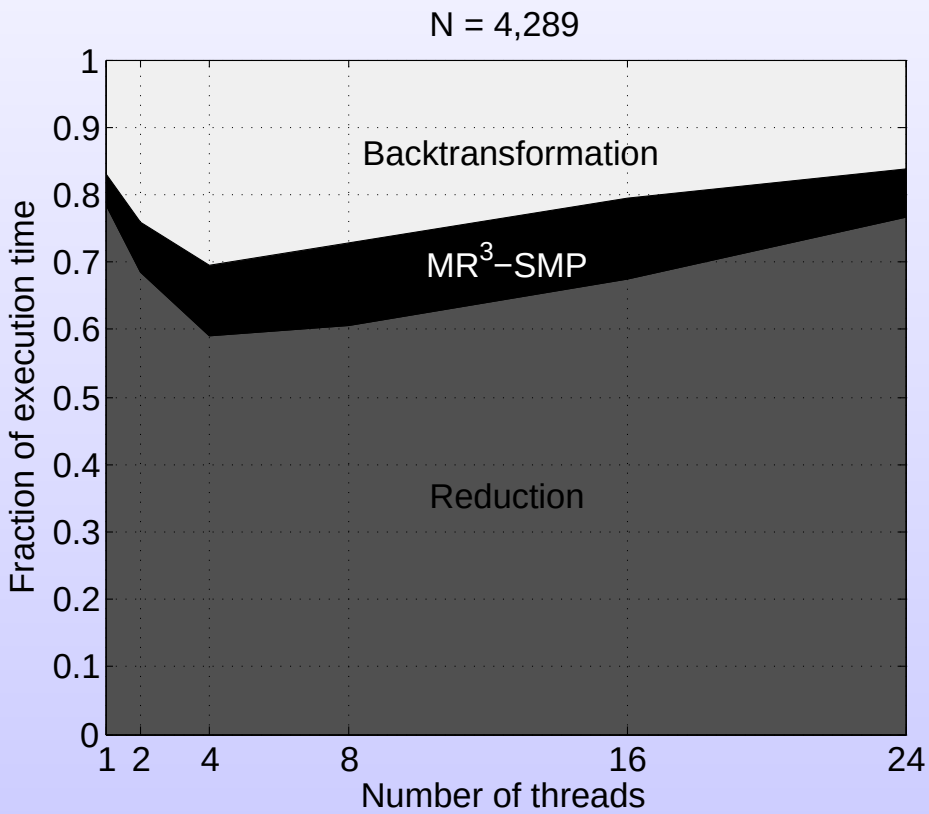
3 stages: before and after





1 The Problem

2 Multicore Processors: MR^3-SMP

3 Distributed Memory Architectures: PMRRR

4 GPUs

Distributed memory

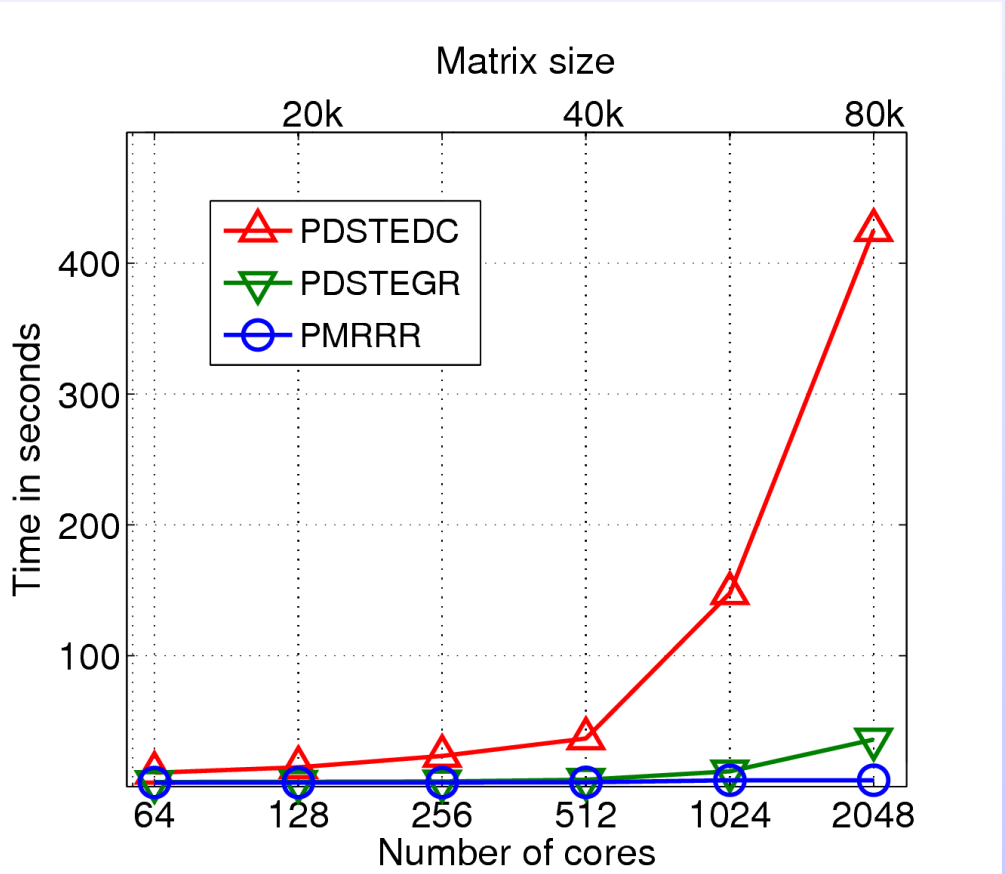
PMRRR, EleMRRR

- Static assignment of eigenpairs to nodes
- Multithreading
- Node-node communication: only eigenvalues
- PMRRR + Elemental $\Rightarrow$ EleMRRR

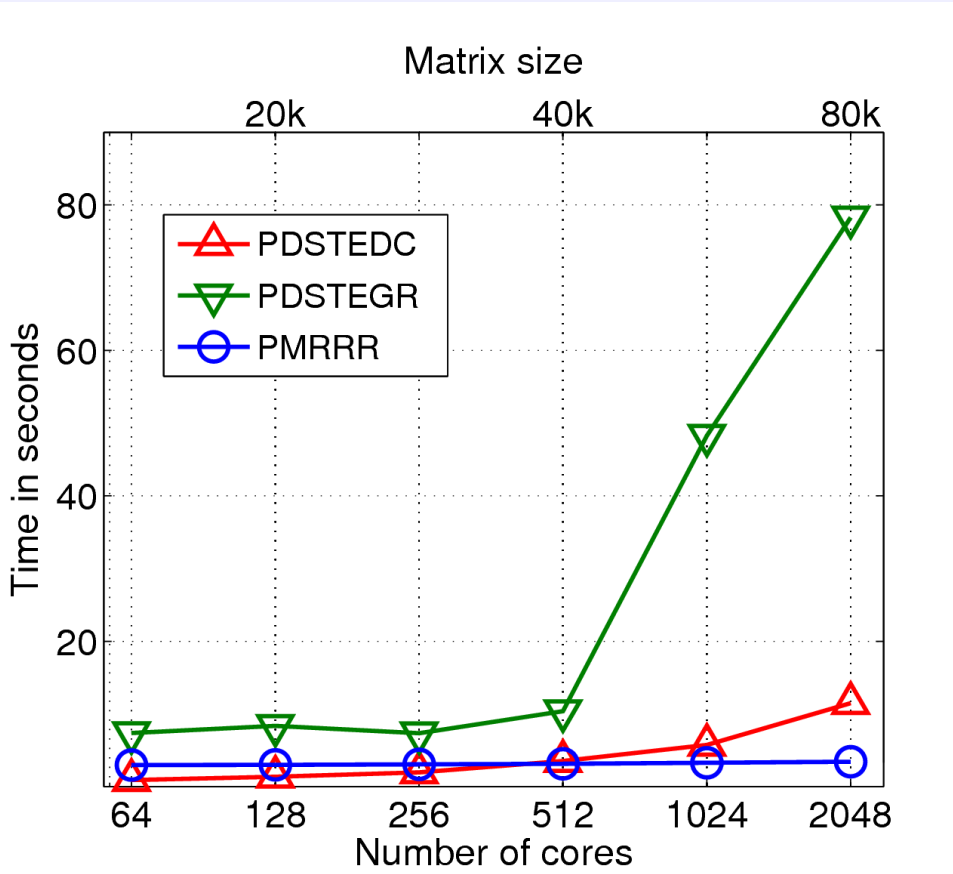
  Generalized, standard and tridiagonal hybrid eigensolvers

TRDEIG: PMRRR

1-2-1 matrix

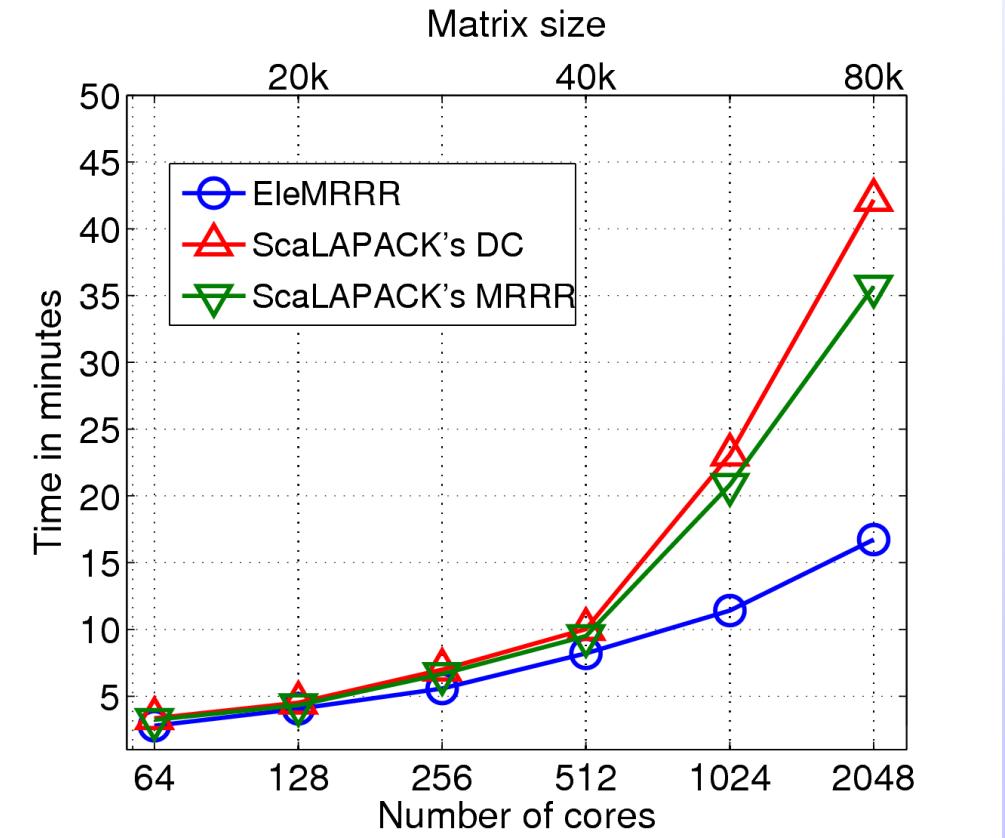


Wilkinson matrix

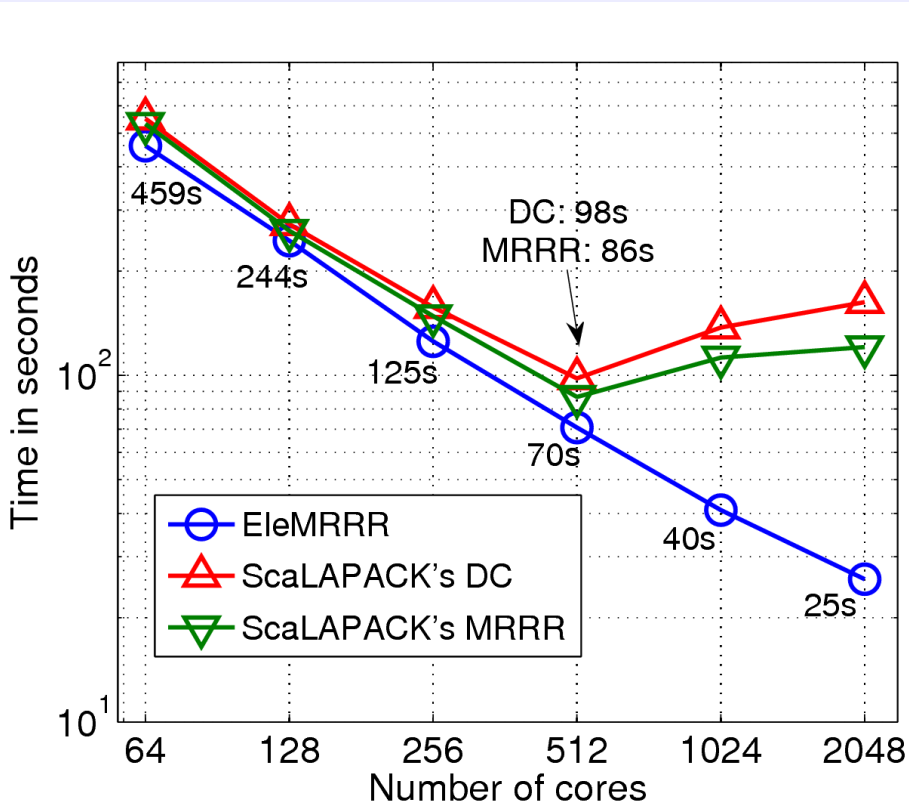


GENEIG: Weak & strong scaling

Weak scalability



Strong scalability, n=20000



GENEIG: Efficiency
