

Music Generation Using Machine Learning

Seminar Computer Music SS 2017

Michael Krause

RWTH Aachen

June 27, 2017

The problem

Can a computer create new music?

- ▶ Applications: assisted composition, video games, music analysis
- ▶ Two broad steps: Composing and creating audio signal
- ▶ Composing: melody, rhythm, structure, instrumentation...

Outline of the talk

History

Current approaches

- Unit selection using deep learning

- Evolutionary multi-objective optimization

Conclusion

History

History: AI research and music generation

- ▶ General trend in AI: move from symbolic methods (GOFAI) to machine learning / data-based approaches
- ▶ Formal grammar approach
 - ▶ Create structure through (stochastic) rewriting rules
 - ▶ Hand-made or learned from data
 - ▶ Terminal symbols can be notes/chords/measures...
- ▶ Markov Chains
 - ▶ States: notes or measures
 - ▶ Transitions: probabilities learned from examples or hand-made
 - ▶ No higher level structure
- ▶ More recently: Machine Learning (e.g. neural networks)

Current approaches

Now: Two approaches for melody generation

- ▶ Melody: essential for most music
- ▶ Competing approaches:
 - ▶ Bretan et al. (2016): uses deep learning
 - ▶ de León et al. (2016): evolutionary algorithm with machine learning based fitness functions

Current approaches:
Unit selection using deep learning

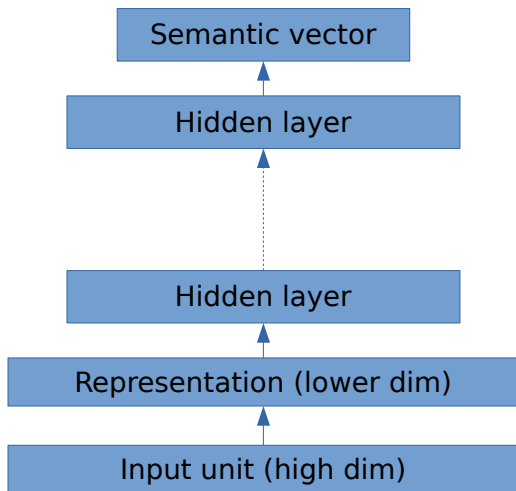

Setup

- ▶ Given: > 4000 melodies (in particular Jazz)
 - ▶ Divide into units (1, 2 or 4 measures of melody)
 - ▶ Create new melodies by concatenating units
 - ▶ Connected units should
 - ▶ share semantic similarity
 - ▶ have pleasant transitions
- Train two neural nets to encode these properties

Neural nets: Basic example

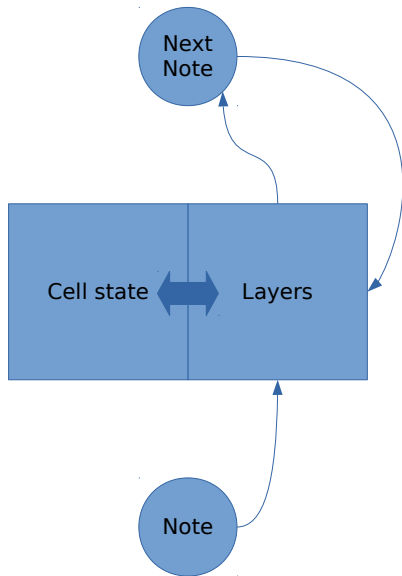

Neural net for semantic similarity

Idea: train semantic vectors for consecutive units to be similar

Neural net for note transitions

Melody generation: Ranking and concatenation

- ▶ Start with some measures of music given
- ▶ Rank all units given the previous measures
 - ▶ Firstly: according to similarity
 - ▶ Secondly: according to note transitions
- ▶ Concatenate measures with highest ranked unit and repeat

(listen to audio example)

Current approaches:
Evolutionary multi-objective optimization

Evolutionary optimization overview

- ▶ Optimization problem in general: candidate solutions and objective function
- ▶ Here: candidates set is “population”, objective is high “fitness”
- ▶ The phenotype (appearance) of a candidate may be different from its genotype (encoding/representation)
- ▶ Initial candidates are repeatedly evolved through
 - ▶ Variation: modify candidates through crossover and mutation
 - ▶ Selection: retain only candidates with good objective value

Evolutionary multi-objective optimization

- ▶ Challenges for evolutionary approach to music
 - ▶ How to encode genotype?
 - ▶ How to generate candidates?
 - ▶ How to evaluate fitness? User interaction?
- ▶ In the present paper
 - ▶ Melodies are trees
 - ▶ Initial melodies are generated randomly
 - ▶ Fitness consists of multiple measures, partly learned from existing melodies of a given style

Melodies as trees

(Figure 1 from [the paper](#))

Crossover and mutation

- ▶ “Fittest” candidates are admitted to crossover and mutation
- ▶ Mutation: With small probability a node is randomly replaced
- ▶ Crossover: Nodes swapped between pairs of candidates (figure)

(Figure 2 from [the paper](#))

Fitness functions

- ▶ 12 separate ones used
- ▶ Function parameters based on body of melodies in a style
- ▶ Examples:
 - ▶ Global descriptors (number of notes, most repeated interval, average pitch and deviation etc.)
 - ▶ Language model (probability of note after previous 4 notes)
 - ▶ Music analysis (e.g. number of segments in melody)
- ▶ Candidate A *pareto-optimal*: for all candidates B with higher fitness than A in some function, B must have lower fitness than A in another function

Results (fitness trained for different styles)

Celtic #3

Pre-bop jazz #1

Two staves of musical notation for 'Pre-bop jazz #1'. The first staff features a melody with eighth-note runs and a dotted quarter note. The second staff continues the melody with eighth-note patterns and a quarter note.

(listen to audio example)

Results (fitness trained for different styles)

Pop #8

(listen to audio example)

Conclusion

Conclusion

Take-home concepts:

- ▶ Move from symbolic to machine learning methods
- ▶ Unit selection using neural networks
- ▶ Melody tree as result of evolutionary optimization

Possible further work:

- ▶ Variety vs. higher level structure
- ▶ Extend approaches to generate harmonization
- ▶ Quality measures?
